TITLE: A Class of Random Pulse Processes. (Ob odnom klasse impulsnykh sluchaynykh protsessov)

PERIODICAL: Radiotekhnika i Elektronika, 1957, Vol.2, No.4, pp. 371 - 379 (USSR)

ABSTRACT: The class of processes considered in the paper is a train of identical pulses, whose leading edges appear at random. It is assumed that the average spacing between the pulses is T and that the train is in the steady state, i.e. it commenced at the time $t = -\infty$. Intervals between the leading edges of neighbouring pulses are governed by a probability density distribution function $p(t)$ [$p(t) \equiv 0$ at $t = 0$], such that the instant of the appearance of the leading edge of a successive pulse is dependent only on the instant of the appearance of a preceding pulse. A quantity $g(t_2/t_1)$ is introduced such that $g(t_2/t_1)dt_2$ is the conditional probability of the appearance of a pulse in an interval t_2, $t_2 + dt_2$, if the preceding pulse commenced at time t_1; $g(t_2/t_1)$ is referred to as the conditional probability density of the pulse train (or series). It is shown that the relationship between $p(t)$ and $g(t_2 = t/t_1 = 0) = g(t/0) = g_0(t)$ is given by:

Soveshchaniye po teorii veroyatnostey i matematicheskoy statistike, Yerevan, 1958

Trudy Vsesoyuznogo soveshchaniya po teorii veroyatnostey i matematicheskoy statistike, Yerevan, 19-25 sentyabrya 1958 g. (All-Union Conference on the Theory of Probability and Mathematical Statistics. Held in Yerevan 19-25 September, 1958. Transactions) Yerevan, Izd-vo AN ArmSSR, 1960. 291 p. Errata slip inserted. 2,500 copies printed.

Sponsoring Agency: Akademiya nauk Armyanskoy SSR.

Editorial Staff: G.A. Abgaryanyan, R.V. Gamkrelidze, Ye.B. Dynkin, Yu.V. Linnik and S. Kh. Tumanyan; Ed. of Publishing House: A.G. Sikmel; Tech. Ed.: M.A. Kaplanyan.

PURPOSE: The book is intended for mathematicians.

COVERAGE: The book contains 41 articles submitted to the Conference and dealing with the theory of probability and mathematical statistics. Some of the articles are the papers read at the Conference and edited for publication, while others outline the theses of papers which appeared or are scheduled to appear, wholly or in part, in other publications; in some cases, such publications are quoted. A list of the papers whose contents were published elsewhere is included and the places of publication are indicated. Individual articles examine theories of mass service, spectral instruments, numbers, games, and certain functions, and discuss the theorems of Shannon, Markov's chains, and certain processes, quantities, and functions. Such items as the method of least squares, the stochastic, Markov's and diffusion processes, measures and their applications, a scheme of Bernoulli experiments, Markov-type random field, visible distribution of stars, Brownian motion, capacity of radio channels, and defective products are considered. No personalities are mentioned. References accompany some of the articles.

TITLE: Some properties of random impulse processes

PERIODICAL: Referativnyy zhurnal, Matematika, no. 12, 1961, 32, abstract 12V192. ("Tr. Vses. soveshchaniya po teorii vercyatnostey i matem. statistike, 1958". Yerevan, AN Arm SSR, 1960, 72-78)

4

TEXT: The importance of random impulse processes for various questions in radio technics is pointed out. Of particular interest in examining such processes are the statistical characteristics of the behavior along the time axis: the characteristics of the pulse-scheme, the intervals between times of impulse appearances, the probabilities of the impulse appering in cartain intervals, etc. It is suggested to consider random impulse processes in which the form of all impulses are derived from a given function h(t) by a transformation with random parameters, e. g.

$h_k(t) = \xi_k h\left(\frac{t-\theta_k}{\tau_k}\right)$ where ξ_k is the amplitude of the k-th impulse, τ_k is

TITLE: The use of an algorithmic method of discerning shapes in the solution of problems in production-connected geophysics

SOURCE: AN SSSR. Doklady*, v. 154, no. 5, 1964, 1082-1083

TOPIC TAGS: exploratory well, mineral, geophysical method, rock strata, electric resistance, cybernetics, petroleum, gas, algorithm, porosity, porosity classification, physical property, oil saturation, sandstone, limestone

ABSTRACT: The investigation of exploratory wells by geophysical methods includes such operations as rock crushing on the basic of lithological differences, the classification of mineral-bearing rock strata and the correlation of such strata on the basic of geophysical data for the purpose of solving geological and production programs. It is very useful, in this connection, to make use

Card 1/2

ACCESSION NR: AP4016506

of cybernetics for the purpose of discerning various shapes under ground. This can be done by feeding the parameters of a number of different rock samples into a machine that will automatically separate, compare and classify them and identify the new types of materials. Such classification will include, for example, clay, sandstone, limestone; oil-, gas- and water-saturated rock; the various rock strata will also be classified on the basis of porosity and other physical properties. The algorithmic method of identification can be used not only for the qualitative solution of problems but also for the classification of rock strata on a quantitative basis, such as percentages of porosity, etc. "M.G. Latyshev and Ye. A. Neyman took an active part in the discussion of a number of questions raised in this article."

PERIODICAL: Izvestiya Akademii nauk SSSR. Otdeleniye khimicheskikh nauk, 1958, Nr 12, pp 1428-1434 (USSR)

ABSTRACT: In the present paper the results of investigations of the kinetics of a joint polycondensation of α-amino acid esters and N-carboxy-α-amino acid anhydride were shown by the example of glycine derivatives as well as of the effect of the relative anhydride concentration (A/E) on the composition of reaction products. The majority of the experiments was carried out with a 5% solution of the initial products in dioxane. It was found that with the content of initial products changing from 0.5 to 10% the amount of the solvent does not exercise any

Card 1/3

Kinetics and Chemism of the Polycondensation of α-Amino Acid Esters. Communication 7: Kinetics of the Change in Composition of Polycondensation Products of Glycine Ethyl Ester in the Presence of N-Carboxy Glycine Anhydride

essential effect on the course of the reaction. The qualitative composition of the polycondensation products was chromatographically investigated. The content of tetra and tripeptide fraction, and of diketo piperazine (Ref 20) was determined by the method of differential titration. The average degree of the polycondensation was determined by measuring the amino nitrogen according to the Van-Slyayk method. At the same time, experiments without solvents were carried out (in the block). In this case all processes developed more rapidly, they did, however, not show any qualitative differences. A comparison between the results obtained and those of the investigation of the polycondensation of glycine ethyl ester in the presence of carbon dioxide (Ref 19) shows that the rules governing this process are basically the same in the course of either process. However, intermediate products in the first polycondensation stage show differences: by the addition of CO_2 a symmetrical carbamate $R'OOC.CHR.NH_3^+.^-OOC.NH.CHR.COOR'$ is formed; by the initiating of N-carboxy amino acid anhydride an asymmetric

carbamate is formed $R'OOC.CHR.NH_3^+.\ ^-OOC.NH.CHR.CO.NH.CHR.COOR'$.

This apparently explains the observed differences in the velocity of the course of the process as well as in the distribution of reaction products in the individual stages.

TITLE: The Kinetics of the Polycondensation of Glycine-ethyl Esters in the Presence of Its Carbamate (Kinetika polikondensatsii etilovogo efira glitsina v prisutstvii yego karbamata)

PERIODICAL: Izvestiya Akademii nauk SSSR. Otdeleniye khimicheskikh nauk, 1959, Nr 5, pp 941-943 (USSR)

ABSTRACT: In the course of previous investigations of the kinetics of the polycondensation of esters of the α-amino acids it has been shown that the initiating effect of carbon dioxide is connected with the formation of the symmetric carbamate: $R'OOC.CHR.NH_3^+.\ ^-OOC.NH.CHR.COOR'$. Carbamate formation is an endothermic reaction, and therefore overheating of the reaction mass may easily occur if CO_2 is added at an increased rate. The carbamate itself causes no thermal impediment to polycondensation. In this connection, the kinetics of the consumption of monomers and the variation of the composition of the polycondensed glycine-ethyl ester obtained in the presence of a carbamate was investigated in the present case. The investi-

Card 1/3

The Kinetics of the Polycondensation of Glycine-ethyl Esters in the Presence of Its Carbamate

gation methods are the same as those of reference 1. The content of free monomers, the reaction product yield, and their diketopiperazine and amino nitrogen content was determined. Figures 1 and 2 show the velocity constant of the consumption of monomers and, accordingly, the concentration of the diketopiperazines in the polycondensation products when carbamate and CO_2 are used as initiators. From the difference alone between the consumption of monomers conclusions are drawn as to a difference in the kinetics of the aggregation of the diketopiperazines. From figure 2, which shows the concentration of diketopiperazines in the final products, a distinct difference in the two initiators may be recognized, especially at the beginning of the reaction. The difference is caused by heating the reaction mass by the endothermal formation of carbamate when using the CO_2-initiator.

When carbamate is used as initiator, the reaction product yield remains proportional to the time of reaction, and also the amino nitrogen (NH_2-N) content in the reaction products remains constant. The authors thank Ye. V. Lecnova for her assistance.

VIII. The Influence of the Initial Content of Carbamate on the Velocity of the Polycondensation of the Ethyl-Ester of Glycine. (Soobshcheniye 8. Vliyaniye nachal'nogo soderzhaniya karbamata na skorost' polikondensatsii etilovogo efira glitsina)

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye khimicheskikh nauk, 1959, Nr 7 pp 1328 - 1332 (USSR)

ABSTRACT: Introducing the well-known mechanism of polycondensation of the esters of α-amino acids under the influence of simple initiators- in this case CO_2- and the formation of initiator substrate is described briefly (Refs 1-4). It had been shown, that the original initiator for the polycondensation is not CO_2, but the symmetric carbamate as the arising substrate. If this is true, it must be the same for

Card 1/5

the velocity of polycondensation, no matter whether carbamate is formed by the addition of CO_2 or is added directly. Moreover, for a small amount of i/m - i/m is the relative, molar initial concentration of the initiator i, related to the monomer m - the consumption of the monomer must be proportional to the initial amount of carbamate. In the investigation of kinetics it had been shown that this proportionality was maintained for all initial concentrations,. The consumption of monomer may be represented by the following equation:

$$m(t) = (1 - 2\xi_0)e^{-k(\xi_0)t}$$

In this paper the above named assumption is investigated. The dependence of the velocity of monomer consumption on the initial concentration of the initiator was investigated. The content of free monomers in the reaction product was

determined by means of the improvement method. Moreover, the consumption of monomers was investigated with immediate initiation with symmetric carbamate. The experimental data for the consumption of monomers with initial concentrations of initiator CO_2 ξ_o = 0.01, 0.02, 0.04, 0.08 and 0.16 are demonstrated in a semi-logarithmic scale in figure 1. For all i/m monomer's consumption is first class. The extrapolation of the straight line cuts the ordinate in the point lgm = 0(m = 1)= m^o . m^o is reduced with increasing ξ_o. Therefore m^o is the exact initial concentration for the secondary stage of the reaction. In the equation obtained from the experiment:

$$m(t) = m^o \cdot e^{-kt}$$

Card 3/5 m^o and k were calculated by the method of the least squares.

Content of Carbamate on the Velocity of the Polycondensation of the
Ethyl-Ester of Glycine

The results are listed in Table 1. $\frac{1 - m^0}{\beta}$ was calculated as the stoichiometrical coefficient of the reciprocal effect of the monomer with CO_2 in the primary stage of reaction. In this case of carbamate initiation m^0 was found to be 0.995 i.e. it was equal to the initial amount of the monomer. This result may serve as evidence that carbamate is formed in the first stage of the reaction. The constants of velocity of monomer consumption in dependence on the initial concentrations of carbamate i/m are listed in table 2. The kinetic curve (Fig 2) is a straight line up to concentrations i/m = 0.07. Moreover the velocity of monomer consumption was proved to be independent of the length of the formed chain of polymers. There are 2 figures, 2 tables, and 7 references, 5 of which are Soviet.

TITLE: Kinetics and Chemism of the Polycondensation of Esters of the α-Amino Acids and Peptides. Communication 9. On the Autocatalytic Nature of the Polycondensation of the Ethylester of Glycine in the Presence of Carbon Dioxide

PERIODICAL: Izvestiya Akademii nauk SSSR. Otdeleniye khimicheskikh nauk, 1959, Nr 8, pp 1453-1457 (USSR)

ABSTRACT: In the present paper the assumption concerning the autocatalytic nature of the polycondensation reaction of the esters of α-amino acids in the presence of CO_2 is investigated. For this purpose the yield of the polycondensation products of ethylglycine ester was measured and their composition determined. The condensation product was fractionated and the products of the solid phase determined by weighing. It consisted of ethyl esters of glycine peptides of various lengths, and diketopiperazine. Several test series with different CO_2 contents in the initial products were carried out. From the yields obtained it could be seen that the polycondensation of ethylglycine ester is an autocatalytic process with a gradual growth of the peptide chain. The growth of the peptide

Card 1/2

chain is more rapid than the formation of new chains. Thus two stages could be observed: formation of new chains and growth of the chains. There are 4 figures, 2 tables, and 5 Soviet references.

TITLE: Polycondensation of Glycine Ethyl Ester in the Presence of Its Carbamate (Polikondensatsiya etilovogo efira glitsina v prisutstvii yego karbamata)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 124, Nr 1, pp 1o5 - 1o6 (USSR)

ABSTRACT: The carbamate formation represents the first stage of the reaction mentioned in the title of the α-amino acids in the presence of CO_2 (Ref 1). It proceeds practically instantly (Ref 2) as compared with the other stages. It was earlier proved (Ref 3) that the course of the polycondensation is determined by the relative initial concentration of the initiator (in this case the carbamate). Although the α-amino acid esters as well as their carbamates are rather stable, they are subjected to polycondensation on CO_2 addition. Thus, carbamate and not CO_2 is the real initiator. Thus, polycondensation must occur also on adding carbamate to the monomeric ester. The rate of the polycondensation and the com-

Card 1/3

position of the resulting products will be independent of the way of introducing the initiator. The purpose of the present paper is to check the assumption that the carbamates actually initiate the polycondensation of the α-amino acid esters in the presence of CO_2. As can be seen from the data on the monomer consumption (Fig 1) the reaction initiated by carbamate is of first order, viz. it proceeds in the same way as on initiation by CO_2. It was earlier proved that the rate of the monomer consumption rises with an increase in the initial concentration of the initiator (Ref 3). In the reaction initiated by carbamate the first stage of the rapid consumption of the initiator is missing. This rapid stage, however, occurs in the initiation by CO_2 (Fig 1) . The chromatographic investigation of the polycondensate proved that the quantitative composition of the reaction products is independent of the way of formation of the initial reaction mixture. There are 1 figure and 7 references, 4 of which are Soviet.

Sponsoring Agency: The International Union of Pure and Applied Chemistry, Commission on Macromolecular Chemistry

Tech. Ed.: T. V. Polyakova.

PURPOSE: This collection of articles is intended for chemists and researchers interested in macromolecular chemistry.

COVERAGE: This is Section I of a multivolume work containing scientific papers on macromolecular chemistry in Moscow. The material includes data on the synthesis and properties of polymers, and on the processes of polymerization, copolymerization, polycondensation, and polyrecombination. Each text is presented in full or summarized in French, English, and Russian. There are 47 papers, 28 of which were presented by Soviet, Rumanian, Hungarian, and Czechoslovakian scientists. No personalities are mentioned. References accompany individual articles.

TITLE: Hydrolysis of the p-Nitro-phenyl Esters of Glycine, Glycylglycine, Diglycylglycine and Their Carbobenzoxy Derivatives

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 132, No. 3, pp. 623-625

TEXT: The paper of the authors deals with the resistivity of the substances mentioned in the title against the basic hydrolysis in the aqueous medium. As is well known, the activation of the carboxyl group is one of the most important phases of the protein biosynthesis (and the peptide synthesis). This activation takes its course in the aqueous medium under much milder conditions. At the biosynthesis, the carboxyl group is activated by means of the decomposition of aminoazyl adenylates. The latter are related to the activated esters of the

α-amino acids and similar with regard to their chemical properties. The reactions of these esters can therefore be used for the simulation of biosynthetic processes, under conditions which are similar to the physiological ones. Since the p-nitro-phenyl esters are only slightly soluble in water, the hydrolysis was studied in aqueous-alcoholic medium (50 volume %) at a constant concentration of the hydroxyl ions. This was obtained by means of buffer solutions (phosphate-buffer M/15, pH 7.20). Alcoholic solutions of the hydrobromides of the esters mentioned in the title, as well as of the carbobenzoxy-diglycine were mixed with the same volume of the buffer mentioned in such a way that the final concentration of the ester amounted to 10^{-4} Mol. The time slope of the hydrolysis was recorded spectrophotometrically. The rate constants of the hydrolysis of the activated esters (Table 1) were calculated from the data (Fig. 1) and used for the evaluation of the reactivity of the esters. The absorption spectrum of some esters in alcoholic solution was measured before mixing with the buffer, and the intactness of the ester was checked. Spectrophotometers of type

Card 2/4

CΦ-4 (SF-4) were used. The authors compare the values of the rate constants of the hydrolysis determined by them with those of other scientists. These two values are in good agreement. The data obtained by the authors also agree with the data from publications, according to which the resistivity of the (nonactivated) ester groups decreases often at the transition from carboxylic acids to the amino acids. As expected, the hydrobromide of the glycine-p-nitro-phenyl esters is most readily hydrolized of all substances investigated. In conclusion, the authors state that the influence of the amino group decreases with the elongation of the peptide chain, whereas the resistivity of the ester group increases and approaches that of the esters of the carboxylic acids. An inverted conformity prevails in the series of the N-carbobenzoxy derivatives: the stability of the p-nitro-phenyl esters decreases through the removal of the carbobenzoxy group. The hydrolysis is considerably accelerated at the transition from glycine to the peptides. The difference in the hydrolysis rates of the peptides is relatively small. There are 1 figure, 1 table, and 13 non-Soviet references.

Abstract : To determine the fractional composition of TiO_2 it is recommended to utilize the pipette-method of sedimentation analysis. To carry out the analysis a suspension of TiO_2 in water is prepared using a triethanol amine - oleic soap mixture as the stabilizer. Dimensions of particles are determined on the basis of sedimentation time, which is calculated according to Stokes formula on the basis of a given diameter of the particles.

TITLE: A Complete Analysis of the Components of Viscose

PERIODICAL: Khimicheskiy volokna, 1959, Nr 6, pp 34-37 (USSR)

ABSTRACT: The authors mention the well-known methods of analyzing viscose (Refs 1-14) and its disadvantages (e.g. too complicated in practice, lack of accuracy). They checked several methods of determining sulfur- and sodium compounds and the γ-number. As a result of their investigations, the authors recommend the following method, in which determination of the individual components is carried out in separate samples. Production of two solutions: 1) Viscose solution. 2) Solution of by-products, obtained by salting out the xanthate with NaCl. The total content of sulfur is iodometrically determined in viscose and by-products after reduction by means of sodium zincate (Ref 15) to Na_2S. Na and S, bound in the xanthate, are determined according to the polymer method (Ref 17). The separate determination of Na_2S and sodium trithiocarbonate is carried out by means of gas analysis of the solution of the

Card 1/2

A Complete Analysis of the Components of Viscose S/183/59/000/06/010/027
B004/B007

by-products (Refs 2, 6) or by means of the titration with $K_3Fe(CN)_6$ worked out by the authors. For the purpose of determining hyposulfite and polysulfide sulfur the well-known method of reference 22 is used. For determining free NaOH and soda the authors developed a new method in an earlier paper (Ref 23). The results obtained by such analyses of viscose are given in a table. There are 1 table and 23 references, 13 of which are Soviet.

TITLE: Temperature Conditions for the Xanthogenization of Alkali Cellulose

PERIODICAL: Khimicheskiye volokna, 1960, No. 2, pp. 60 - 63

TEXT: The authors report on the determination of the esterification degree of cellulose xanthogenate in dependence on the duration of xanthogenization and on temperature (0-40°). The experiments were carried out in a VA apparatus on refined sulfite cellulose (containing 91.6% of α-cellulose). The soda lye concentration was 200 g/l. Carbon disulfide was added at a rate of 40% of the α-cellulose content. The experimental data are presented as follows: Fig. 1, dependence of γ on the duration of xanthogenization (10 min to 10 h) at 20, 25, and 30°; Table 1, content of bound CS_2 in the xanthogenate in dependence on temperature and duration of the process; Fig. 2, dependence of γ on the duration of xanthogenization at temperatures between 0 and 40°; Table 2, amount of CS_2 used for the formation of secondary products; Table 3, data of the fibers produced. The authors arrived at the following results: During the process of xanthogenization, the curves for γ pass a maximum which is explained by the simultaneous esterification of alkali

Card 1/2

cellulose and the decomposition of the xanthogenate. An increase in temperature accelerates both the formation of xanthogenate and that of secondary products. The temperature factor of cellulose xanthogenization is about 2. Between 20 and 30°, there is no strict dependence between gamma number and temperature in spite of accelerated xanthogenization. It is only observed that gamma falls from 55 (at 20°) to 50 (at 30°). In this temperature range, no differences in the distribution of CS_2 were observed. In the wide range between 0 and 40°, the dependence of gamma on temperature is more distinct (70 at 10°, 48 at 40°). Accordingly, the CS_2 distribution also changes. If the xanthogenization in the VA apparatus is carried out in such a way that at the beginning of reaction a high temperature prevails which decreases during the reaction, the duration of viscose production can be considerably reduced. There are 2 figures, 3 tables, and 13 references, 8 of which are Soviet.

Title : The Culture if Isolated Embryos and Tissues as a Method of Selecting Citrus Plants.

Orig Pub : Byul Vses. n.-i. in-ta chaya i subtrop. kul'tur, 1957, No 1, 178-195, 180-197.

Abstract : This article describes the technique, studied at the All-Union Institute of Tea and Subtropical Cultures, of growing the embryos of citurs plants in artificial media for the purpose of developing the methods of breeding the citrus varieties with a view of raising their frost and malsecco resistance. The best nutrient solution for

Errata slip inserted. 1,000 copies printed.

Resp. Ed.: A.K. D'yachkov, Doctor of Technical Sciences, Professor; Tech. Ed.: B.K. Shorin.

PURPOSE: This book is intended for technical personnel engaged in the design of machines and mechanisms.

COVERAGE: This collection of scientific papers, presented at a conference held July 2-3, 1958, deals with the theory of machines and mechanisms, strength of machine parts, friction and wear in machines, and machine-building technology.

Krasnoshchekov, N.N. Theoretical Basis for Determining Accuracy of Spur Gears With K.L. Novikov Tooth Action 65

Korablev, S.S. Investigation of Resonance Properties of Mechanical Systems 75

Results of theoretical and experimental investigations of the process of transition through resonance in mechanical vibrating systems are presented. The results of an investigation of resonance properties of a centrifugal vibrator with non-linear restoring force are discussed.

Kurlykin, L.A. Dynamics of the Transition Through Resonance of Vibrating Shafts With Different Moments of Principal Inertia, With the Coupling to an Engine Taken Into Account 89

Vibrations of shafts with different principal moments during transition through the zone of static instability are investigated. Equations of motion and methods for their solution are presented.

Chipov, K.A. Investigating the Process of Producing Splines on Shafts by Broaching or Planing With Gang Tools 101

Basic theoretical considerations on the selection of methods for cutting splines in shafts are developed. Broaching and planing are experimentally investigated and recommended as the most efficient methods for cutting splined shafts in large-lot and mass production.

Kosarev, L.Ye. Investigation of Methods of Compacting Casting Molds 121

The effect of vibrations on the process of compacting molds by compression is investigated. Results indicate that vibrations make it possible to obtain uniformity of density at compression pressures several times lower than those used in compacting without vibration.

Devkin, M.B. Investigation of Contact Areas of Rough Surfaces 131

The relationship between the actual contact area (consisting of elastic and plastic contact areas), the surface roughness, and the material properties of two surfaces in contact is investigated. Results indicate that the size of the actual contact area is considerably affected by the geometry of the surface.

Krasnenkin, M.P. Investigation of the Accuracy of Determining Gear by the Method of Crescent-shaped Indentations 143

An experimental investigation was made of the accuracy of determining metal wear by the indentation method, involving measurement of the length and calculation of the reduction of depth of a crescent-shaped recess cut into the metal surface. The method of investigation and the special instruments used are described.

Kabaynenko, A.F. Investigation of Lubricant Circulation in a Model of the Oil Bath of a Vertical-pivot Thrust Bearing Used in Large Hydraulic Turbines 155

Lubricant flow in the bath and between shoes of a thrust bearing (without cooling) was investigated by a thermoanemometric method. A testing machine, built for this purpose at the Hydrodynamic Friction Laboratory, Institut mashinovedeniya, AN SSSR (Institute of Machine Science, Academy of Sciences, USSR), is used. The results of the investigation are described.

Churkhadov, G.Kh. Investigation of Stresses in Frames With Plate-like Cross Beams 167

The author discusses an experimental and theoretical investigation of stresses in composite and solid frame structures. The non-linear distribution of stresses and strains are shown in diagrams.

KHURSHUDOV, G.Kh.
